

Step-by-Step Guide to Set Up DNS in Cloudflare

1 Log in to Your Cloudflare Dashboard:

- Go to <https://dash.cloudflare.com> and sign in with your account credentials associated with goldenharbour.com.

2 Navigate to Domain Management:

- From the dashboard home, click on "Domains" or "Domain Registration" in the sidebar (if available). If not visible, select your account, then find "Manage Domains" or directly search for your domain in the list.

3 Select Your Domain:

- Click on "goldenharbour.com" to open its management page.

4 Go to the Nameservers Section:

- Look for the "Overview" tab or "Nameservers" tab. If Cloudflare allows custom changes (rare for their registrar), there should be an option to edit or switch to custom nameservers.

5 Change to Custom Nameservers:

- Select the option for "Custom nameservers" or "Use your own nameservers."
- Enter the VPS nameservers:
 - Nameserver 1: ns1.server-640316.flexibel.ae
 - Nameserver 2: ns2.server-640316.flexibel.ae
- If prompted, add any required glue records (IP addresses for the nameservers if they are under the same domain—check with your VPS provider for these).

6 Save and Confirm Changes:

- Click "Save" or "Update."
- Confirm any verification steps, such as email confirmation or captcha.
- Note: Changes can take 24-48 hours to propagate. Use tools like <https://www.whatsmydns.net> to check if the nameservers have updated globally.

7 Log in to Your VPS Control Panel:

- Access your VPS hosting account (likely via a URL like <https://your-vps-ip:2083> or provided by your host).

- Assuming it's cPanel (common for VPS hosts; if it's Plesk or another panel, the steps are similar—contact your provider if unsure). Log in with your credentials.

🔍 **Navigate to DNS Management:**

- In cPanel, scroll to the "Domains" section and click "Zone Editor" or "Advanced Zone Editor."

🔍 **Select or Add Your Domain:**

- If the domain isn't listed, add it first via "Addon Domains" or "Domains" section.
- Click "Manage" next to goldenharbour.com.

🔍 **Add A Records for the Domain:**

- Click "Add Record" or "+ A Record."
- For the root domain (goldenharbour.com):
 - Type: A
 - Name: @ (or leave blank if @ isn't supported—it represents the root)
 - Address/IPv4: 66.116.198.157
 - TTL: 14400 (or default, like 1 hour).
- Click "Add" or "Save."
- For the www subdomain (www.goldenharbour.com):
 - Type: A
 - Name: www
 - Address/IPv4: 66.116.198.157
 - TTL: 14400.
- Alternatively, for www, use a CNAME:
 - Type: CNAME
 - Name: www
 - Target: goldenharbour.com (or @)
 - TTL: 14400.

- If you have other records (e.g., MX for email, TXT for verification), add them as needed.

🔍 Verify the Setup:

- Wait 5-60 minutes for changes to take effect on the VPS.
- Test by pinging goldenharbour.com or using <https://dnschecker.org> to confirm it resolves to 66.116.198.157.
- Access your website in a browser to ensure it loads from the VPS.
